

This Class (Lecture 18):

Explosions to Neutron Stars

Next Class:

Black Holes Don't Suck

HW #7 due on Sunday

Music: *Supernova* – Liz Phair

Mar 25, 2008

Astronomy 122 Spring 2008

- The famous amateur astronomer David Levy (ever heard of the Shoemaker-Levy comet?) will be giving a talk on campus tonight.
 - Shakespeare as a Skywatcher: Joining Astronomy with English Literature (Beckman at 7:30pm)
- Go and write a 1-2 page **typed** report that includes:
 - 1) Summary of the cool ideas
 - 2) What aspect did you find really interesting?
 - 3) Relate somehow to class topics.
- Turn in to your discussion section by April 2nd, then you can earn up to 0.5% on your final grade!

Mar 25, 2008

Astronomy 122 Spring 2008

Outline

- High mass stars → supernova/neutron star or black hole

Mar 25, 2008

Astronomy 122 Spring 2008

Evolutionary Path of a Solar-Mass Star

Mar 25, 2008

Astronomy 122 Spring 2008

Evolutionary Path of a High-Mass Star

Mar 25, 2008

Astronomy 122 Spring 2008

When the Hydrogen Runs out?

- Similar to lower-mass stars in the first few stages
- When the hydrogen supply runs out the core starts to contract
- Hydrogen shell burning (around the helium core) starts
- The outer envelope expands quickly becoming a **red supergiant**

Mar 25, 2008

Astronomy 122 Spring 2008

In 5 Billion years...

Mar 25, 2008

Astronomy 122 Spring 2008

More than one way to fuse

- High-mass stars do fusion by a second process
- Called the *CNO cycle*
 - Still converts 4 hydrogens into 1 helium
 - Uses a carbon nucleus as a catalyst
- Requires very high temperatures in the core
 - More than low-mass stars (like the Sun) can produce

The CNO Cycle

Mar 25, 2008

Astronomy 122 Spring 2008

Question

What causes any star to leave the main sequence?

- Just gets tired of the main-stream lifestyle.
- Runs out of hydrogen in the core.
- Runs out of helium in the core.
- A shell around the core begins to burn helium.
- A shell around the core begins to burn hydrogen.

Mar 25, 2008

Astronomy 122 Spring 2008

The Supergiant Phase

- Outer envelope of the star grows larger and cooler
 - Up to 5 AU in size!
 - Unlike a low mass star, brightness does not increase dramatically
- Eventually, core is hot enough that it can fuse helium atoms together (non-degen gas, so no flash)
 - Star contracts and heats up
 - Now a **blue supergiant**

Mar 25, 2008

Astronomy 122 Spring 2008

Evolutionary Path of a High-Mass Star

Mar 25, 2008

Astronomy 122 Spring 2008

Massive Stars: Cycles of Fusion

- Helium fusion is not the end for massive stars
- Cycles of core contraction, heating, ignition
- Ash of one cycle becomes fuel for the next
 - hydrogen \Rightarrow helium
 - helium \Rightarrow carbon & oxygen
 - carbon \Rightarrow neon, sodium, & magnesium
 - neon \Rightarrow oxygen & magnesium
 - oxygen \Rightarrow silicon & sulfur
 - silicon \Rightarrow iron

Mar 25, 2008

As

Massive Stars: Cycles of Fusion

- Onion-skin like structure develops in the core
- Has layers.... like an Ogre..

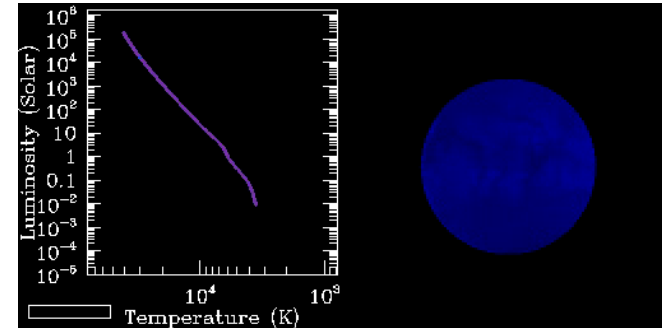

<http://servantsthoughts.blogspot.com/2007/08/onion-theory.html>

Mar 25, 2008

Astronomy 122 Spring 2008

High Mass Stars ($> 8 M_{sun}$)

Mar 25, 2008

Astronomy 122 Spring 2008

Iron – The End of the Road

- Supergiants “burn” heavier and heavier atoms in the fusion process
- Each stage faster than the last
- After iron - no fuel left!
 - It requires energy to produce heavier atoms

Stage	Temperature	Duration
H fusion	40 million K	7 million yr
He fusion	200 million K	500,000 yr
C fusion	600 million K	600 yr
Ne fusion	1.2 billion K	1 yr
O fusion	1.5 billion K	6 mo
Si fusion	2.7 billion K	1 day

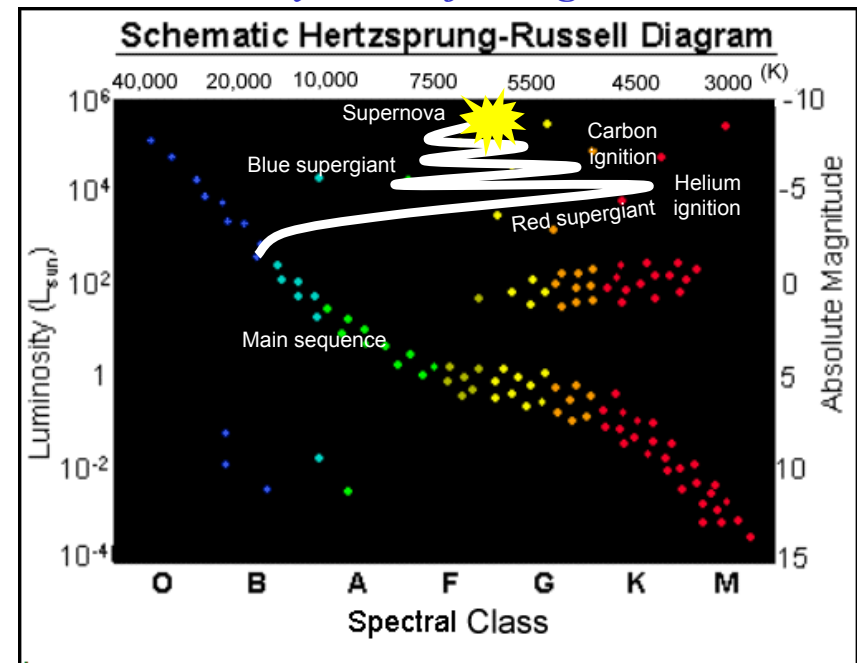

Values for a $25 M_{sun}$ star

Mar 25, 2008

Astronomy 122 Spring 2008

Evolutionary Path of a High-Mass Star

Mar 25, 2008

Astronomy 122 Spring 2008

Core Collapse

- Completely out of gas!
- Hydrostatic equilibrium is gone.
- The iron core of the star is supported by electron degeneracy pressure
 - Same pressure that supports a white dwarf
- Eventually, gravity wins...
 - This happens when the core reaches 1.4 solar masses
 - Remember the Chandrasekhar limit

Mar 25, 2008

Astronomy 122 Spring 2008

When Electron Degeneracy Just Isn't Enough

Mar 25, 2008

Astronomy 122 Spring 2008

Question

What is the force that supports a white dwarf but can not support a massive stellar core.

- Pressure from fusion
- Pressure from CNO fusion
- Electron degeneracy pressure
- Gravity pressure
- Neutron degeneracy pressure

Mar 25, 2008

Astronomy 122 Spring 2008

Core Collapse

- When core is greater than $1.4 M_{\text{sun}}$ – **core collapse!**
 - From 1,000 km across to 50 km in *1/10th of a second*
 - **Nearly 10% speed of light!**
- The core is transformed into a sea of neutrons
 - Electrons are squeezed into protons, neutrinos released
 - The core has nuclear density!
 - If Earth has same density, it would be 1000 feet in diameter

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova!

- During collapse, part of the core rebounds and produces a shock wave
 - Material is so dense, that it is opaque to the neutrinos produced
 - Neutrinos give the shock a “kick”
 - Rips the outer layers of the star apart
- Star explodes in a **supernova**
- Releases a tremendous amount of energy
 - 99% of the energy in the form of neutrinos
- >90% of the mass of star is ejected into space!
 - Fast, hot,

10 milliseconds

20 milliseconds

Mar 25, 2008

Astronomy 122 Spring 2008

AstroBlaster!

“Astroblaster illustrates the laws of conservation of momentum and energy during the creation of a supernova (an old star, that having exhausted its nuclear fuel, collapses upon itself in less than a second). A shock wave speeds outward from the center through the collapsed material, moving faster and faster as it reaches less dense layers toward the surface. This shock wave accelerates an outermost thin layer of the collapsed star to relativistic speeds, creating “cosmic rays” that spread throughout our galaxy. The gravitational collapse of the dying star is illustrated by Astro-Blasters’ fall to the surface. The shock wave accelerating outward through the star is illustrated by a wave of increasing speed as the result of the impact which is felt by the lighter balls nearer the top. The supernova explosion and release of cosmic rays is illustrated by the rapid departure of the top ball at high speed.”

— Sterling A. Colgate, Astrophysicist

INSTRUCTIONS:

- Hold tip of AstroBlaster rod which extends through the smallest ball.
- Hold away from body at arms length.
- Release when AstroBlaster is hanging straight down.
- AstroBlaster capsule can reach heights of over 5 times the drop height.

SAFETY FEATURE:
Ball will not blast unless AstroBlaster hits vertically.

CAUTION:
To avoid possible eye injury, hold away at arms length when releasing.

Item # ASTR1

Mar 25, 2008

Astronomy

Question

In the astroblaster demo, what did the little red ball represent?

- The inner core of the massive star
- The envelope of the massive star
- A low-mass stellar companion to the high mass star.
- Iron.
- Vitamin C

Mar 25, 2008

Astronomy 122 Spring 2008

Game Over!

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova!

- The lifetime battle against gravity is lost.
- The core collapses under its own weight.
- Much of the mass of the outer region of the star, bounces back into space.

Mar 25, 2008

Astronomy 122 Spring 2008

Death throes

- What triggers a supernova?
 - Hydrostatic equilibrium is lost, gravity wins
 - Iron core with $M > M_{\text{Chandra}}$
- What happens?
 - Quick core collapse overcoming electron degeneracy pressure.
 - Outer layers rebound off the core, explosion of envelope
- What are end products?
 - Enriched ejecta and compact neutron star (if core mass < 3 solar masses)

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova Explosions

The Death of Massive Stars $> 10 M_{\text{sun}}$

- Spectacular
- Rare
- Crucial for life
...but don't get too close...

What do we see?

- Bright: can outshine galaxy
- Rapid changes in time:
 - max in days
 - dims over weeks
- Shock waves
Fast, ultra-hot gas

Light from a single supernova

Combined light of 100 billion stars

How Close is Too Close?

Minimum safe distance:

About 30 light years
Note: nearest star is 4 light years

30 light years

Q: ill effects of cosmic WMD?

Mar 25, 2008

Astronomy 122 Spring 2008

Cosmic WMDs

- Death of a nearby massive star would be bad news.
- Explosion within 30 light years modifies the solar wind

Mar 25, 2008

Astronomy 122 Spring 2008

Surgeon General's Warning: Supernovae are Dangerous to Your Health!

mass extinction due to SN

DNA damage due to high-energy particles (neutrinos)

Radiation damage to atmosphere

- ❖ Destruction of ozone layer ...which is bad because?...
- ❖ No protection from ultraviolet (UV) light
- ❖ Then Sun's UV unfiltered
- ❖ Kills small plants/bacteria at bottom of food chain
- ❖ Damage all the way up

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova Explosions Near Earth

In our Milky Way galaxy:

- About 1 SN/century
- Most far away: spectacular but harmless

Now: no nearby massive stars

Sleep well tonight!

But over the 4.5 billion year history of Earth:

Many nearby events!

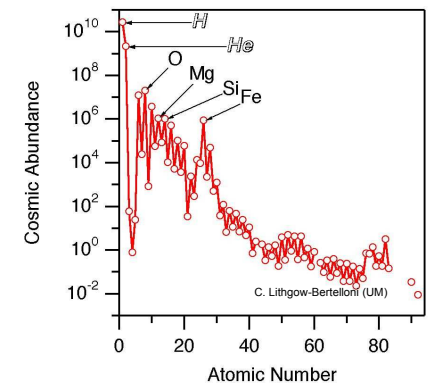

Mar 25, 2008

Astronomy 122 Spring 2008

Making Heavy Elements

- During the explosion, energy-consuming fusion reactions are possible
- Heavy elements up to plutonium (& beyond?) are produced
- Dominant product: iron

Mar 25, 2008

Astronomy 122 Spring 2008

Making Heavy Elements

- These by-products are *blasted* into space (>90% of star)
- Ejection is fast, hot, and enriched.
- Supernovae provide much of the building blocks for planets... and us!
- **We are recycled supernova debris!**
- **Star stuff.**

Mar 25, 2008

Astronomy 122 Spring 2008

Delenn, B5

Stellar Evolution Re-Cycle

Mar 25, 2008

Astronomy 122 Spring 2008

Question

Why are we star stuff?

- a) We are all going to Hollywood.
- b) We are made up of small bits and pieces of stars.
- c) We use fusion for power.
- d) We have the elements that were forged in the interior of stars.
- e) We are just stuff.

Mar 25, 2008

Astronomy 122 Spring 2008

Stellar Evolution Cycle

- Stars form out of the interstellar medium
- They manufacture helium, carbon, nitrogen and more in their interiors by nuclear fusion
- Heavier elements (iron, lead, uranium, etc..) are made by supernovae
- Stars give these processed materials back to the interstellar medium when they die
- The processed materials are included in the gas and dust out of which the next generation of stars and planets will form

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova Explosions in Recorded History

- 1054 AD
- Europe: no record
- China: “guest star”
 - So bright, could see it during the day for most of July.
- Anasazi people
 - Chaco Canyon, NM
 - Rock Paintings
- Modern view of this region of the sky:
 - **Crab Nebula** — a supernova remnant
 - Massive star supernova

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova Explosions in Recorded History

- November 11, 1572
- Recorded by Tycho Brahe
 - Called it a “**nova stella**” (new star)
- For about two weeks the supernova could be seen in the daytime!
- Modern view (X-rays):
 - Tycho’s Supernova Remnant
- Probably a white dwarf supernova (Ia)

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova 1987A

Original star was a B3 blue supergiant

Before

Feb. 23, 1987

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova 1987A

- Supernova are rare
- Only about ~3/century in a galaxy.
- Last was 400 yrs ago (Tycho)
- 1987A happened in the satellite galaxy LMC (150,000 lyrs away)
- Star was about 20 M_{\odot}
- Detected neutrinos from the core (most of explosion energy) for 13 secs about 20 detected.

IMB
Kamiokande

Mar 25, 2008

Supernova 1987A - Today

Mar 25, 2008

Astronomy 122 Spring 2008

Supernova Leftovers

- What's left of the star's core after a massive star supernova?
- A **neutron star**
 - About 1.4 – 3 solar masses
 - Very small diameter – around 20 km!
 - Composed of a sea of neutrons
 - Supported by *neutron degeneracy pressure!*
 - Teaspoon of neutron star material on Earth would weigh almost 1 billion tons!!!!
 - Surface gravity – 200 billion times that on Earth
 - Escape velocity – half the speed of light

Mar 25, 2008

Astronomy 122 Spring 2008

Relative Sizes of Stellar Corpses

Neutron star

Mar 25, 2008

Astronomy 122 Spring 2008

- In the late 1960s, Jocelyn Bell discovered radio pulses from the constellation Vulpecula that repeated regularly
 - Every 1.337... seconds
- What could it be?
- Perfect timing, but no real encoding of signal.
- Jokingly called LGMs, then Pulsars.

Jocelyn Bell Burnell

Anthony Hewish

Mar 25, 2008

Astronomy 122 Spring 2008
<http://www.tadrosky.com/rspplsr.html>

Pulsars

- What could it be?
 - Pulses were too fast to be a variable star
- A rotating star?

Mar 25, 2008

Astronomy 122 Spring 2008

Pulsars

- Very precise, better than atomic clocks.
- Periods from 8.51s to 1.56 ms!
- Could they be something spinning?
 - Would have to be small to be spinning that fast
- They must be spinning neutron stars!

Mar 25, 2008

Astronomy 122 Spring 2008
