

Astronomy 210

This Class (Lecture 33):

Life and Death of Other Stars

Stardial 2 is available.

Next Class:

Supernovae and Neutron Stars

Apr 15, 2005

Astronomy 210 Spring 2005

Outline

- The story of more massive stars.
 - Burning up to iron.
- Supernovae!
- Neutron stars
- Pulsars

Apr 15, 2005

Astronomy 210 Spring 2005

Evolutionary Path of a Solar-Mass Star

Apr 15, 2005

Evolutionary Path of a High-Mass Star

Apr 15, 2005

Life Fast, Die Young

- High-mass stars: “gas guzzlers”
 - Very bright
 - Consume hydrogen fuel supply very quickly
 - Only live for millions of years on the main sequence

TABLE 11-1 Main-Sequence Lifetimes

Mass (M_{\odot})	Surface temperature (K)	Luminosity (L_{\odot})	Time on main sequence (10^6 years)	Spectral class
25	35,000	80,000	3	O
15	30,000	10,000	15	B
3	11,000	60	500	A
1.5	7,000	5	3,000	F
1.0 (Sun)	6,000	1	10,000	G
0.75	5,000	0.5	15,000	K
0.50	4,000	0.03	200,000	M

Apr 15, 2005

Astronomy 210 Spring 2005

And when the Hydrogen Runs out?

- Similar to lower-mass stars in the first few stages
- When the hydrogen supply runs out the core starts to contract
- Hydrogen shell burning (around the helium core) starts
- The outer envelope expands quickly becoming a **red supergiant**

Apr 15, 2005

Astronomy 210 Spring 2005

The Supergiant Phase

- Outer envelope of the star grows larger and cooler
 - Up to 5 AU in size!
 - Unlike a low mass star, brightness does not increase dramatically
- Eventually, core is hot enough that it can fuse helium atoms together (non degen gas, so no flash)
 - Star contracts and heats up
 - Now a **blue supergiant**

Apr 15, 2005

Astronomy 210 Spring 2005

Massive Stars: Cycles of Fusion

- Helium fusion is not the end for massive stars
- Cycles of core contraction, heating, ignition, burning
- Ash of one cycle becomes fuel for the next
 - $C + He \Rightarrow O$
 - $O + He \Rightarrow Ne$
 - ... Up to iron
- Onion-skin like structure develops in the core

Apr 15, 2005

Astronomy 210 Spring 2005

Iron – The End of the Road

- Supergiants “burn” heavier and heavier atoms in the fusion process
- Each stage faster than the last
- After iron - no fuel left!
 - It requires energy to produce heavier atoms

Stage	Temperature	Duration
H fusion	40 million K	7 million yr
He fusion	200 million K	500,000 yr
C fusion	600 million K	600 yr
Ne fusion	1.2 billion K	1 yr
O fusion	1.5 billion K	6 mo
Si fusion	2.7 billion K	1 day

Values for a $25M_{\text{Sun}}$ star

Astronomy 210 Spring 2005

Apr 15, 2005

Evolutionary Path of a High-Mass Star

Apr 15, 2005

Core Collapse

- Completely out of gas!
- Hydrostatic equilibrium is gone.
- The iron core of the star is supported by electron degeneracy pressure
 - Same pressure that supports a white dwarf
- Eventually, gravity will win...
 - This will happen when the core reaches 1.4 solar masses
 - Remember the Chandrasekhar limit
- When it goes over the limit – **core collapse!**
 - From 1,000 km across to 50 km in *1/10th of a second*

Apr 15, 2005 *Nearly 10% speed of light!* Astronomy 210 Spring 2005

When Electron Degeneracy Just Isn't Enough

Apr 15, 2005

Astronomy 210 Spring 2005

Supernova!

- Core basically becomes a large atomic nucleus— ultra-high density!
- During collapse, envelope “bounces” of stiff core and produces a shock wave
 - Material is so dense, that it is opaque to the neutrinos produced
 - Neutrinos give the shock a “kick”
 - Rips the outer layers of the star apart
- Star explodes in a **supernova**
- Releases a tremendous amount of energy
 - 99% of the energy in the form of neutrinos
- >90% of the mass of star is ejected into space!
 - Fast, hot,

10 milliseconds

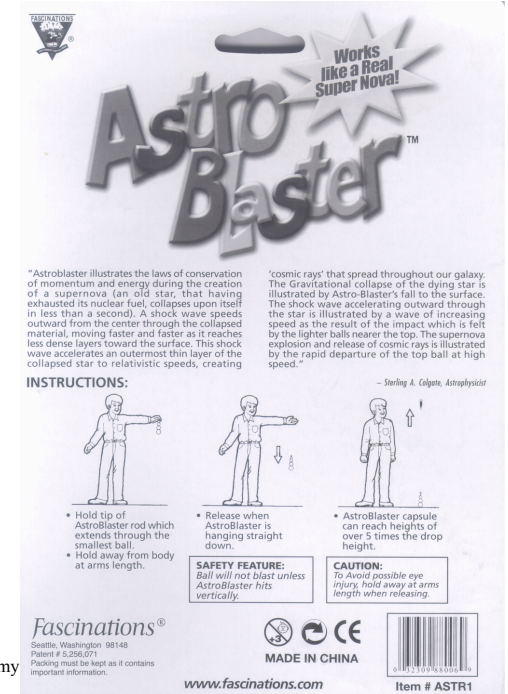

20 milliseconds

Apr 15, 2005

Astronomy 210 Spring 2005

Apr 15, 2005

Astronomy

Supernova!

Apr 15, 2005

Astronomy 210 Spring 2005

Bright as a Galaxy

- Supernovae are **bright**
 - A star's brightness increases 10,000 times!
 - Rivals an entire galaxy!

Light from a single supernova

Combined light of 100 billion stars

Apr 15, 2005

Astronomy 210 Spring 2005

Making Heavy Elements

- During the explosion, energy-consuming fusion reactions are possible
- Heavy elements up to plutonium (& beyond?) are produced
- Dominant product: iron
- These by-products are *blasted* into space (>90% of star)
- Ejection is fast, hot, and enriched.
- Supernovae provide much of the building blocks for planets... and us!
- **We are recycled supernova debris!**
- **Star stuff.**

Astronomy 210 Spring 2005

DeLenn, B5

Stellar Evolution Cycle

Apr 15, 2005

Astronomy 210 Spring 2005

Stellar Evolution Cycle

- Stars form out of the interstellar medium
- They manufacture helium, carbon, nitrogen and more in their interiors by nuclear fusion
- Heavier elements (iron, lead, uranium, etc..) are made by supernovae
- Stars give these processed materials back to the interstellar medium when they die
- The processed materials are included in the gas and dust out of which the next generation of stars and planets will form

Apr 15, 2005

Astronomy 210 Spring 2005

Another Way to Make a Supernova

- If a white dwarf in a binary system steals enough matter, it can go over the Chandrasekar Limit
- The white dwarf collapses under its own gravity
- Carbon and oxygen fuse into iron and nickel
- Star rips itself apart in a thermonuclear explosion
 - White dwarf is destroyed

Apr 15, 2005

Astronomy 210 Spring 2005

Bright Supernovae

- Core-collapse supernovae are called Type II
- Type Ia supernovae are brighter than Type II's!

Apr 15, 2005

Astronomy 210 Spring 2005

Supernova Explosions in Recorded History

- 1054 AD
- Europe: no record
- China: “guest star”
- Anasazi people
 - Chaco Canyon, NM
 - Rock Paintings
- Modern view of this region of the sky:
 - Crab Nebula** — a supernova remnant
- Massive star supernova

Apr 15, 2005

Astronomy 210 Spring 2005

Supernova Explosions in Recorded History

- November 11, 1572
- Recorded by Tycho Brahe
 - Called it a “**nova stella**” (new star)
- For about two weeks the supernova could be seen in the daytime!
- Modern view (X-rays):
 - Tycho's Supernova Remnant
- Probably a white dwarf supernova (Ia)

Apr 15, 2005

Astronomy 210 Spring 2005

Supernova 1987A

Before

Feb. 23, 1987

Apr 15, 2005

Astronomy 210 Spring 2005

Supernova 1987A

- Supernova are rare
- Only about ~3/century in a galaxy.
- Last was 400 yrs ago (Tycho)
- 1987A happened in the satellite galaxy LMC (150,000 lyrs away)
- Star was about $20 M_{\odot}$
- Detected neutrinos from the core (most of explosion energy) for 10 secs about 20 v.

Apr 15, 2005

Astronomy 210 Spring 2005

Supernova 1987A - Today

Apr 15, 2005

Game Over!

Apr 15, 2005

Supernova Leftovers

- What's left of the star's core after a Type II supernova?
- A **neutron star**
 - About 1.4 – 2 solar masses
 - Very small diameter – around 20 km!
 - Composed of a sea of neutrons
 - Supported by *neutron degeneracy pressure!*
 - Teaspoon of neutron star material on Earth would weigh almost 1 billion tons!!!!
 - Surface gravity – 200 billion times that on Earth
 - Escape velocity – of half the speed of light

Apr 15, 2005

Astronomy 210 Spring 2005

Relative Sizes of Stellar Corpses

Neutron star

Apr 15, 2005

Astronomy 210 Spring 2005

- In the late 1960s, Jocelyn Bell discovered radio pulses from the constellation Vulpecula that repeated regularly
 - Every 1.337... seconds
- What could it be?
- Perfect timing, but no real encoding of signal.
- Jokingly called LGMs, then Pulsars.

Jocelyn Bell Burnell

Anthony Hewish

Apr 15, 2005

Astronomy 210 Spring 2005
<http://www.radiosky.com/rspplsr.html>

Pulsars

- What could it be?
 - Pulses were too fast to be a variable star
- What can they be?
- A rotating star?

Apr 15, 2005

Astronomy 210 Spring 2005

Rotating Star?

Max possible rotation rate at equator: when gravity balances centripetal acceleration.

$$v_c = \sqrt{\frac{GM}{R}}$$

But

$$v_c = \frac{2\pi R}{P}$$

so

Apr 15, 2005

Astronomy 210 Spring 2005

Rotating Star?

Solve for P

$$P = \frac{4 \times 10^5 \text{ s}}{\sqrt{\rho}} \quad \rho \text{ in kg/m}^3$$

Apr 15, 2005

Astronomy 210 Spring 2005

Rotating Star?

For shortest possible pulsar known of $P=1 \text{ ms}$

$$P = \frac{4 \times 10^5 \text{ s}}{\sqrt{\rho}} \quad \rho \text{ in kg/m}^3$$

$$\Rightarrow \rho_{\min} \geq 10^{17} \text{ kg/m}^3$$

Must be a neutron star! $V_{\text{esc}} > 1/3 c$!

Apr 15, 2005

Astronomy 210 Spring 2005

Pulsars

- What could it be?
 - Pulses were too fast to be a variable star
- Very precise, better than atomic clocks.
- P from 1s to 1ms!
- Could they be something spinning?
 - Would have to be small to be spinning that fast
- They must be spinning neutron stars!

Apr 15, 2005

Astronomy 210 Spring 2005

What are Pulsars?

- When the core collapses, its spin and magnetic field strength increases
- Typically
 - Surface field strength over 1 trillion times that of the Earth
 - Rotation rate up to 1000 times per second
- Magnetic field beams radiation into space
- If the Earth is in the beam's path, we see the pulsar

Apr 15, 2005

Astronomy 210 Spring 2005

What are Pulsars?

- When the core collapses, its spin and magnetic field strength increases
- Typically
 - Surface field strength over 1 trillion times that of the Earth
 - Rotation rate up to 1000 times per second
- Magnetic field beams radiation into space

Astronomy 210 Spring 2005

Crab Nebula – Remnant of the Supernova of 1054

Apr 15, 2005

Astronomy 210 Spring 2005

When Neutron Degeneracy Isn't Enough

- Maximum neutron star mass
 - About $3.0 M_{\text{Sun}}$
- Beyond this mass, neutron degeneracy cannot stop gravity
- Nothing left to stop total collapse– gravity rules!
- A **black hole**... $v_{\text{esc}} > c$
