

Astronomy 230

Section 1– MWF 1400-1450

106 B6 Eng Hall

This Class (Lecture 7):

Planet Formation and

Next Class:

Extrasolar Planets

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Outline

- From molecular clouds to baby stars– protostars.
- Star formation requires a circumstellar disk that is often seen around young stars.
- The origin of the Solar system also requires a disk of material in which dust clumped, forming planetesimals, then planets.
- Planets are different due to distance away from Sun..

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

HW #2: Due Sept 20th

1. Using a web search engine, find a web page about aliens, ET intelligence, or UFOs that interests you (not about your presentation topic). Use at least 2 key words for search. Write down your key words, URL, and print main page (only 1 page necessary).
2. Write a 3-4 sentence summary of web page content.
3. Critique web page in another 3-4 sentences.
 - Does it have a scientific basis?
 - Does it use common sense reasoning?
 - Does it sound reasonable?
4. List one thing good and one thing that sounds crazy (if possible) from the webpage conclusions.
5. Be prepared to discuss in class.

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

The Importance of being a Molecular Cloud

- Different than the clouds that formed the First Stars
- Stars form in cold, dense molecular clouds (normally starless)
 - Colder, as molecules and dust easily emit in the radio and infrared.
 - Thus, clumps more easily, as the material is cold, forming regions of high density.
- Formation of more complex molecules
 - Density allows for more collisions, interactions, formation of molecules
 - *Maybe formed biological compounds?*

C¹⁸O emission from L483

How do we know?

- Young stars are seen near molecular clouds.
- In infrared light, we can see into the deeper regions of clouds, and see clusters of young stars with circumstellar material (dust and gas) surrounding them.
- Stars are continuously being formed in our galaxy.

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Young Stars

The Birthplace of Stars

- Young stars often are seen in clusters
- Very young stars are also associated with clouds of gas (nebulae)

The Trapezium
Sept 10, 2004

L.W. Looney

Lifecycle of a Star

- Star formation
 - Take a giant molecular cloud core with its associated gravity and wait for 10^4 to 10^6 years.
- Main sequence life (depends on mass!)
 - Few $\times 10^6$ years to more than age of Universe
 - Thermonuclear burning of H to He
- Death
 - Exhaust hydrogen
 - Red giant / supergiant or supernova
 - White dwarfs, neutron stars, black holes

Sept 10, 2004

Astronomy 230 Spring 2004

Stars like the Sun

Massive stars

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

- The fundamental building blocks of the Universe.
- High mass stars are 8 to 100 solar masses
 - Short lived: 10^6 to 10^7 years
 - Luminous: 10^3 to $10^6 L_{\text{sun}}$
 - Power the interstellar medium– input of energy
- Intermediate Stars are 2 to 8 solar masses
- Low mass stars are 0.4 to 2 solar masses
 - Long Lived: $>10^9$ years
 - Good for planets, good for life.
 - Not so luminous: 0.001 to $10 L_{\text{sun}}$

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Star Formation

Stars are born in cold, dense interstellar clouds

- Cold gas
- Dust grains

Star formation is probably triggered by

- Cloud turbulence
- Collision with another cloud
- Nearby supernova explosion
- Nearby hot star wind
- Disturbance from the Galaxy

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Gravitational Contraction

- As we discussed for the first stars, the gravity of the gas and dust clumps push the clumps together, but there is some resistance from pressure and magnetic fields to collapse.
- Probably as the cloud core collapses, it fragments into blobs that collapse into individual stars.
- Cloud becomes denser and denser until gravity wins, and the clumps collapse under their own mass– a protostar.
- This process is slower than for the first stars where the clumps were much more massive.
- As the collapse proceeds the molecules and dust emit light, keeping the temperature of the core low.

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Cloud Contraction

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

But..

- Not all mass falls in directly. Why?
- All gas has a small spin that preferentially causes the formation of a flattened structure – time for an interlude.

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Interlude: Angular Momentum

Spinning or orbiting objects in closed system have angular momentum.

Angular momentum is a single, *constant* number: =*conserved*!

Keep same dist. to axis → velocity same

Move closer to axis → speed up!

Recall Kepler 2nd law – really due to angular momentum!

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

When Doves Cry and Stars Form

Solar nebula competition:
Gravity vs Angular Momentum

- If fall perpendicular to spin axis
speed up → resistance
centrifugal force
- If fall parallel to spin axis
same speed, so no resistance
→ form *protoplanetary disk*
 - Origin of ecliptic!
 - Organizes orbits in same direction
 - Organizes spins along initial spin axis

On to the Main Sequence: A Star is Born!

Sept 10, 2004

- Density increase, temperature increases until fusion can occur.
 - Blows away most of its natal circumstellar material.
 - Becomes a star on the main sequence of the HR diagram,
 - For low mass stars, this whole process can take 10^6 years.
 - Expect to see a large number of embedded protostars.

Some outstanding Star Formation Issues

- Why do the cores collapse, but not the entire molecular cloud?
- What sets the sizes of cores, and hence masses of stars?
- What determines how stars cluster, group together, or form multiple systems?

Sept 10, 2004

Astronomy 230 Spring

A. Nordlund
L.W. Looney

So, Why would Spock Care?

- If we are to suppose that ET life will be based on a planet orbiting a star, then we need to know
 - How did our solar system form?
 - How rare is it?
 - Is our solar system unusual?

Sept 10, 2004

What is the origin of the Solar System?

- Explain present-day Solar System data.
- Predict results of new Solar System data.
- Should explain and predict data from other stars!

What are clues to solar system origins?

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Some Facts of the Solar System

- We have 8 or 9 planets.
 - Pluto, an anomaly in many ways, probably a Kuiper object or moon of Neptune. Other Kuiper objects are being found.
- So perhaps the average extrasolar system has about 10 planets (rounded off).
- The Sun has 99.9% of the mass, but the planets have 98% of the angular momentum (energy stored in orbits)

Sept 10, 2004

L.W. Looney

Some Facts of the Solar System

- Outer planets more massive than inner planets.
- Most of the motions in the Solar System are counter clockwise (problems with Venus, Uranus, or Pluto) in a flat system (pancake-like).
- The inner planets are rocky and the outer planets are gaseous.

Some Facts of the Solar System

- Numerous collisions occurred in the early Solar System
 - Origin of Moon, Lunar craters, Uranus's orbit, and Pluto
- Planets are not evenly spaced– factors of 1.5 to 2.
 - Sun/Saturn distance is 2x Sun/Jupiter distance
 - Sun/Mars distance is 1.5x Sun/Earth distance

Data: Planet's Dance

<http://janus.astro.umd.edu/javadir/orbits/ssv.html>

Data: The Structure of the Solar System

- What are the furthestmost solar system objects from the sun and what is their distribution?

Icy objects or long period comets

**Furthermost objects form the Oort cloud!
So...Spherical Geometry.**

Data: Kuiper Belt

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Data:

What is the age of the Solar System?

- Earth: oldest rocks are 4.4 billion yrs
- Moon: oldest rocks are 4.5 billion yrs
- Mars: oldest rocks are 4.5 billion yrs
- Meteorites: oldest are 4.6 billion yrs
- Sun: models estimate an age of 4.5 billion yrs

Age of Solar System is probably around 4.6 billion years old

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Origin of Solar System: Solar Nebula Theory

Gravitational Collapse

“nebula” = cloud

- The basic idea was put forth by Immanuel Kant (the philosopher)– Solar System came from a Gas Nebula:
- 4.6 billion years ago: a slowly spinning ball of gas, dust, and ice with a composition of mostly hydrogen and helium formed the early Solar System.
- This matches nearly exactly with the idea of star formation developed last class.

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

The Early Solar System

- A massive cloud of gas and dust
 - Seeded with elements from
 - Big Bang (hydrogen, helium, etc.)
 - Elements from planetary nebula pushed into space by red giant.
 - Elements blown from across galaxy by supernovae.

The cloud collapsed under its gravity and formed the circumstellar disk from which our solar system formed. Most theories for solar system formation require disks with masses of 0.01 to 1 solar masses.

Sept 10, 2004

Astronomy 230 Spring 2004

L.W. Looney

Everyone Loves Disks

- As the star forms, the inner region of the disk gets much hotter than the outer regions, creating a temperature gradient.
- The inner part of the disk had a higher density than the outer regions.
- Icy mantles of dust grains (NH_3 , CH_4 , etc.) evaporated at varying distances.

Sept 10, 2004

Astronomy 230 Spring 2004

Planet Formation in the Disk

Heavy elements clump

1. *Dust grains* collide, stick, and form planetesimals— about 10^{12} of them, sort of like asteroids! All orbit in the same direction and in the same plane.
2. Gravity Effects: Big planetesimals attract the smaller planetesimals. So, fewer and fewer of large objects (100's). Collisions build-up inner planets and outer planet cores.
3. Collisions can also account for odd motions of Venus (backwards), Uranus (rotates on its side), and Pluto (high inclination of orbit). Proof of period of high collision evident on moon
