## This Class (Lecture 8):

Nature of the Solar System

Extrasolar planets

*HW2 due on Sept 20th*

## Next Class:

Habitable Planets

Music: *Planet of Sound* – Pixies

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# Outline

- How did our Solar System form?
- Extrasolar planets: watch them wobble.
- Not exactly what we expected.
- What to expect in the future.
- What is  $f_p$ ?

Sept 13, 2004

# Data: Kuiper Belt

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

## Data: What is the age of the Solar System?

- Earth: oldest rocks are 4.4 billion yrs
- Moon: oldest rocks are 4.5 billion yrs
- Mars: oldest rocks are 4.5 billion yrs
- Meteorites: oldest are 4.6 billion yrs
- Sun: models estimate an age of 4.5 billion yrs

**Age of Solar System is probably around 4.6 billion years old**

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

## Origin of Solar System: Solar Nebula Theory

### Gravitational Collapse

- The basic idea was put forth by Immanuel Kant (the philosopher)– Solar System came from a Gas Nebula:
- 4.6 billion years ago: a slowly spinning ball of gas, dust, and ice with a composition of mostly hydrogen and helium formed the early Solar System.
- This matches nearly exactly with the idea of star formation developed last class.

“*nebula*” = cloud

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

## The Early Solar System

- A massive cloud of gas and dust
  - Seeded with elements from
    - Big Bang (hydrogen, helium, etc.)
    - Elements from planetary nebula pushed into space by red giants.
    - Elements blown from across galaxy by supernovae.

The cloud collapsed under its gravity and formed the circumstellar disk from which our solar system formed. Most theories for solar system formation require disks with masses of 0.01 to 1 solar masses.

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

## Everyone Loves Disks

- As the star forms, the inner region of the disk gets much hotter than the outer regions, creating a temperature gradient.
- The inner part of the disk had a higher density than the outer regions.
- Icy mantles of dust grains ( $\text{NH}_3$ ,  $\text{CH}_4$ , etc.) evaporated at varying distances.

Sept 13, 2004

Astronomy 230 Fall 2004

# Planet Formation in the Disk

## Heavy elements clump

1. *Dust grains* collide, stick, and form planetesimals– about  $10^{12}$  of them, sort of like asteroids! All orbit in the same direction and in the same plane.
2. Gravity Effects: Big planetesimals attract the smaller planetesimals. So, fewer and fewer of large objects (100's). Collisions build-up inner planets and outer planet cores.
3. Collisions can also account for odd motions of Venus (backwards), Uranus (rotates on its side), and Pluto (high inclination of orbit). Proof of period of high collision evident on moon

Astronomy 230 Fall 2004

# What it might have looked like.

Astronomy 230 Fall 2004

L.W. Looney

# Test Of Exoplanets

Planets around other stars  
= extrasolar planets = “*exoplanets*”

## Hard to find!

*Cannot* just look at star

- Planet lost in glare

**The Earth is 1 billion times fainter than the Sun!!!!**

*Can* use effect of gravity.

- Star pulls on planet,
- Newton 3<sup>rd</sup> Law: But planet pulls on star with equal & opposite force
- Planet lighter, wobbles a lot (called orbits)
- But star must wobble too!

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# Finding Planets

1. Radial Velocity
2. Astrometry
3. Transit Method
4. Optical Detection

**To date no extrasolar planet has been detected directly. Remember that planets in our Solar System are bright because they reflect light from the Sun.**

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# Star Wobble: Radial Velocity

Newton's 3<sup>rd</sup> Law:

- Both planet and star move
- Both orbits fixed around the “center of gravity”
- Star's period? Place your bets...
  - Same as planet
- Star movement too small to see
  - Moves in small, tight circle
  - But “wobble” in star speed detected!

<http://www.howstuffworks.com/planet-hunting2.htm>

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# The Sun's Wobble

*Astrometric displacement of the Sun due to Jupiter (and other planets) as at it would be observed from 10 parsecs, or about 33 light-years.*

*If we could observe this, we could derive the planetary systems– also called astrometry.*

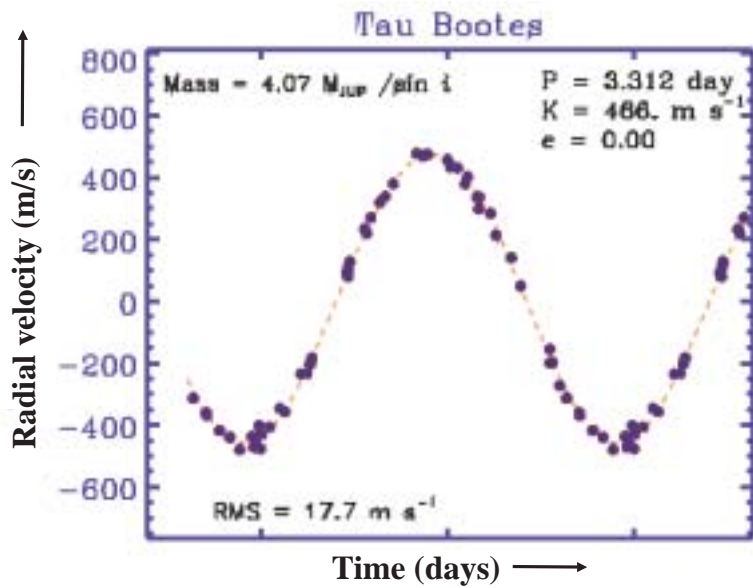

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# Radial Velocity Shifts: Planets around other Stars?

oney

# Early Discovery-- 1996

## PLANETS AROUND NORMAL STARS

Hear all about it.

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

As of Jan,  
there are  
at least 118  
planets  
around  
other  
nearby  
Stars.

# Exoplanets: *Results to Date*

Over 118 planets detected so far

- More than 10 times the number in our Solar System!
- By measuring the wobble variation:
  - With time, gives the planet distance
  - The bigger the wobble, the heavier the planet

Sept 13, 2004

# Planet Transits

# Transits

- <http://www.howstuffworks.com/planet-hunting2.htm>
- A few solid detections.

# Other Planets, Other Stars

47 Ursae Majoris System— 51 light years away (near the Big Dipper). 13 years of data has shown 2 planets— 1 Jupiter like and 1 Saturn like.

**Wow!**

# Exoplanets: *Results to Date*

No Surprise:

- ✓ New planets are massive
- ✓ Why? Need massive planets to see the wobble
- ✓ If not massive, we could not have found them yet

Big Surprise:

- ? Period of few days— whip around stars
- ? Most planets are very near stars!
- ? Example: tau Boo is 3.6 x Jupiter mass, but closer than Mercury's orbit!
- ? If a Jupiter-like planet formed close in, perhaps that prevents terrestrial planets from forming.

# What Are We Looking For?

## General Predictions of Solar Nebula Theory

- ☺ Are interstellar dust clouds common? **Yes!**
- ☺ Do young stars have disks? **Yes!**
- ? Are the smaller planets near the star?  
*Not the ones found so far!*
- ? Are massive planets farther away?  
*Not most of the ones found so far!*

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# Exoplanets: Implications

## Solar Nebula Theory:

- Giant planets born far from star

## Exoplanet Data:

- Giant planets found very close

Theory is *incomplete/wrong!*

## New questions:

- ? Who is normal: Them or us?
- ? Are giant planets born close in?
- ? Are some giant planets born far out, move in?  
“planet swallowing”!?!)

Anyway: Planets are common!

- ✓ Good news in search for life elsewhere...maybe

# Future Projects

- Atacama Large Millimeter Array (ALMA): 2010
  - mm interferometer:
  - direct detection of young gas giants
- Kepler: 2007
  - Planet Transits
- Next Generation Space Telescope
  - James Webb Space Telescope (JWST): 2011
    - Direct imaging of forming gas giants?
- Space Interferometry Mission (SIM): 2009
  - Astrometry
- Terrestrial Planet Finder (TPF): 2012
  - Coronagraph
  - IR interferometer
- Terrestrial Planet Imager (TPI): 2015
  - Either a visible band coronagraph or a large-baseline infrared interferometer. Imaging extrasolar Earths!!!!

Sept 13, 2004

# Now, for $f_p$

- About 2/3 of all stars are in multiple systems.
  - Is this good or bad?
- But disks around stars are very common, even many of the binary systems have them.
- Hard to think of a formation scenario without a disk at some point– single or binary system.
- Disk formation scenario matches our solar system parameters.

Sept 13, 2004

Astronomy 230 Fall 2004

L.W. Looney

# Now, for $f_p$

- We know of many brown dwarves, so maybe some planets do not form around stars.
  - There might be free-floating planets, but...
- Extrasolar planet searches so far give about  $f_p \sim 0.03$ , but not sensitive to lower mass systems.
- Maximum is 1 and lower limit is probably around 0.02. What number do you prefer?
- A high fraction assumes that the disks often form planets.
- A low fraction assumes that even if there are disks, the planets do not form.
- This is not Earth-like planets, just planets.

Sept 13, 2004
