ET: Astronomy 230

HW 7 due on Friday!

Presentations Monday Nov 7th

Nick Warren Jeff Greenswag Jennifer Brown

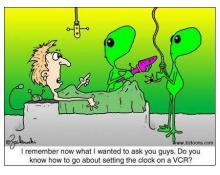

This Class (Lecture 29):

Origin of Intelligence

Next Class:

Cultural Evolution

Music: Space Oddity – **David Bowie**

Astronomy 230 Fall 2004

Outline

- Early Life-making the atmosphere.
- Summary of life on Earth.
- What is intelligence?
- Development of intelligence.
- Brains Brains

Nov 2, 2005

The rise of the primates!

Making Oxygen!

- The early prokaryotes played a crucial role for life on Earth by producing oxygen through photosynthesis.
- Cyanobacteria (was called blue-green algae) changed the world!
- Lived in colonies that formed mats or films, growing into large structures called stromatolites.
- Still around, but much more common before 700 Myrs ago.

Astronomy 230 Fall 2004

Nov 2, 2005

Making Oxygen!

- Oxygen was new and important step in intelligence
- It allowed a new energy extraction method
 - Aerobic (using oxygen) metabolism
 - More complex life.
 - Created ozone layer (dry land now an option for life on Earth).

Nov 2, 2005 Astronomy 230 Fall 2004

Relationship to ETs

- Would evolution on other planets have a similar timescale?
- Evolution is not a deterministic process.
- Selection seems to be mostly luck, rather than adaptation.
- On the other hand, many traits have developed in several lineages— warm blood and eyes.
- Some say that intelligence seems to increase in many lineages, so it is likely that if live exists then intelligent life exists.
- On the other hand, the plant kingdom never developed neurons.

Astronomy 230 Fall 2004

Nov 2, 2005

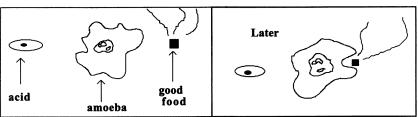

Evolution of Intelligence

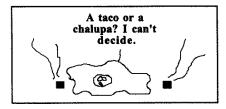

- Through diversity, evolution has resulted in an increase in the complexity of organisms on Earth.
- Can we associate complexity with intelligence?
- If intelligence is an advantageous trait, it is plausible that intelligence would increase over time.
- But, what is intelligence?

An Amoeba Distinguishes

- Has a model of its environment.
- What if two pieces of food are placed nearby?

Nov 2, 2005 Astronomy 230 Fall 2004 L.W. Looney Nov 2, 2005

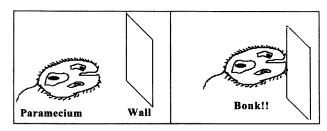

L.W. Looney

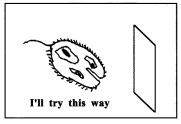

The Intelligent Paramecium?

- Still one celled, but more complex.
- Has a kind of primitive memory.

Nov 2, 2005

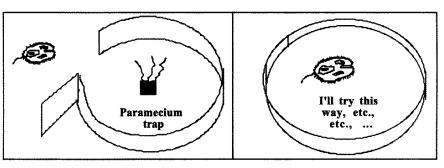

Astronomy 230 Fall 2004

L.W. Looney

Intelligence Breakdown

- Doesn't realize to give up.
- Smarter than the amoeba, but no genius.
- With complexity does come some intelligence.
- There seems to be a continuum of intelligence.

Nov 2, 2005

Astronomy 230 Fall 2004

L.W. Looney

Evolution of Intelligence

- A general definition is "the ability to model the world, including the organism's own self".
- But even single-celled animals seem to be able to do that to some degree.
- Can think of intelligence as a continuum, not a unique aspect of humans.
- Why then, does there seem to be a gap between us and the rest of life on Earth?

Origin of Human Intelligence

- If we view intelligence as a continuum, then we are not essentially different than other organisms.
- Still need a quantitative measure of intelligence.
- Intelligence could be defined by the amount of information stored in the organism. DNA storage.

Astronomy 230 Fall 2004

DNA Storage

- We'll use bits of information
 - Yes = 1
 - -No=0

Nov 2, 2005

- Each codon has 3 bases or 6 bits (3 x 2)
- Humans have (3×10^9) bases x 2 bits per base = 6×10^9 bits, like 4000 books of 500 pages.

Astronomy 230 Fall 2004 L.W. Looney

Development of Intelligence

Caveats

- Existence of large amount of <u>junk DNA</u> makes it problematic to measure intelligence by number of DNA possibilities
 - $-\,$ Only about 2% of human DNA actually codes proteins, then humans have 1.2 x 10^8 bits, or 800 books
 - For some organism the junk DNA is significant: Newts and lilies would have more than 10¹¹ bits.
- Keep in mind that less intelligent organism did not disappear, so there is <u>no trend</u> for organisms to get smarter.
- The **diversity** of life with time led to **some** species with intelligence.

Limited Pockets in Genes

- There are limits to how much info genes can store.
- If you try to store too much info, mutations can wipe you out.
- For eukaryotes, the error rate is about 10⁻⁹, limiting the amount of storage to about 10¹⁰ bits.
- What did life do?
- Evolution devised a new way (extra-genetic) to store information.
- Life developed a nervous system and brains. More bits of storage that are R/W. We can learn!

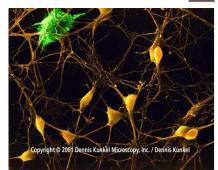

Info Storage in Brains?

Ì

- Information storage in DNA is straightforward, but in the brain?
- There are 10¹¹ nerve cells (called neurons) in a human brain, but they do not work in binary form, more analogbased.
- And they are interconnected a neuron can be connected (with synapses) to 10³ other neurons.

Nov 2, 2005

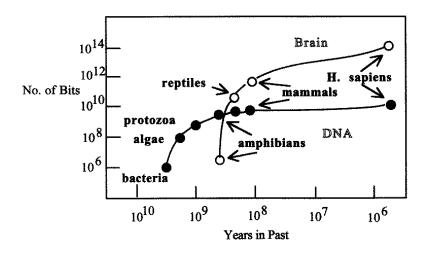

• An impulse triggers a chain of neurons to "fire" causing a reaction. So, really the information is stored in synapses. $10^{11} \times 10^3 = 10^{14}$ bits

Development of Intelligence

Astronomy 230 Fall 2004

Nov 2, 2005

L.W. Looney

Intelligence

- It seems that intelligence is a desirable trait.
- And we can argue for a rough connection between the rise of complexity and intelligence.
- Increased diversity is the key. With more organisms of all types, a more intelligent species is reasonable.
- Still, the point of the Drake equation is to find civilizations with which to communicate, so we need to think about developing human-like or better, intelligence.

nttp://www.newenglandfilm.com/news/arcl ves/03march/reviews.htm

Human-Level Intelligence

- Our species is the only one on Earth to have developed a technological civilization.
- How likely is that to happen on other planets?
- Actually the development of humans is still controversial, even among anthropologists. New fossils are appearing that change our understanding.
- Mammals first appeared on the fossil stage about 200 Myrs ago, but were minor players until about 65 Myrs ago.

Nov 2, 2005 Astronomy 230 Fall 2004 L.W. Looney Nov 2, 2005 Astronomy 230 Fall 2004 L.W. Looney

Primates

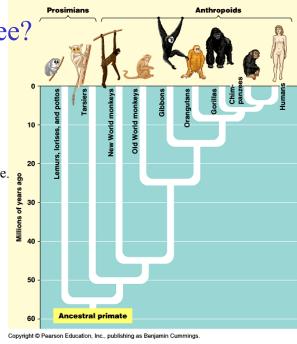

- Main characteristics:
 - Flat fingernails
 - Eyes in front of face
 - No sharp teeth or claws
 - Some have large brain-to-body rations, but most do not.
 - Primarily adapted to life in trees
- Basically, with <u>one</u> large exception, primates have not been very successful.

Nov 2, 2005

Family Tre<mark>e?</mark>

- General trend of adaptation to tree life.
- From toe claws to gripping with large toes or fingers (thumbs).
- This allowed for tool use.
- From nocturnal to daylight.
- More vision—a rounded face with forward eyes and color vision.
- These mutations were random.

Difference

Nov 2, 2005

Ancestors

- Overall, the evolution leading to H. sapiens was not a smooth and steady path.
- At some points there were 4-6 distinct hominid species living.
- Modern humans emerged from a situation with many variant species adapting to fill different environmental niches.
- Only one path lead to much larger brains, and we do not truly understand what environmental factor favored it.

Nov 2, 2005 Astronomy 230 Fall 2004

L.W. Looney

f_i Considerations

- Complexity leads to intelligence, but complexity seems to require a benign environment. Harsher environments have simpler organisms.
- Perhaps life may exist on harsh planets, but more intelligent life?
- Remember, human intelligence took 4.5 billion years.
- Systems too near the center of the galaxy are more likely to be hit with supernovae event in that time.
- 4.5 Byrs is about half the age of our galaxy. Were we fast or slow? <u>Fast</u>: severely limits ETs. <u>Slow:</u> there can be multiple ETs.

Astronomy 230 Fall 2004

L.W. Looney

f_i Considerations

- Intelligent life is a <u>very</u> recent development on Earth with the emergence of the primates, hominids, and H. sapiens.
- Everyone agrees that this particular evolution will not occur on other planets.
- But, will the characteristics of H. sapiens be common to human-like intelligence?
 - Manipulative organs
 – hands
 - Walking upright?
 - Is tool use and larger brains associated with walking upright?
 - Pair bonding?
 - Human brains quadruple in size after birth compared to other primates which double.

f_i Considerations

• How unique is our intelligence?

Nov 2, 2005

- Teaching sign language to chimps and gorillas have shown they are more intelligent than we thought.
- Whales and dolphins are speculated to be of high intelligence.
- With all of this in hand, we are ready to make the next estimate in the Drake equation.
- This term is only intelligent life that can communicate abstract thought to each other, not technological able to communicate.

Nov 2, 2005 Astronomy 230 Fall 2004 L.W. Looney Nov 2, 2005 Astronomy 230 Fall 2004 L.W. Looney

What is f_i

- What is the fraction of life that forms human or better intelligence in less than about 4.5 billion years?
- If you think that it always does, then $f_i = 100\%$
- If you think that it is a statistical fluke or required supernatural invention then you could use 1/billion or $10^{-70}\%$.
- Anywhere in between is fair game.
