This Class (Lecture 3):

Cosmology and the Origin
of Elements

Next Class:

The Early Galaxy and the
First Stars

Jan 26, 2004

Astronomy 230 Spring 2004

Outline

- The fate of the Milky Way.
- Cosmology. How old is the Universe?
- The seeds of galaxies.
- The early Universe was a supercollider.
- Big Bang Nucleosynthesis
- Cooling into normal stuff.
- What is the probable fate of the Universe?
- How does the lack of metals in the early Universe impact life?
- The Early Milky Way.

Jan 26, 2004

Astronomy 230 Spring 2004

Our Galaxy

Spring 2004

Fate of the Milky Way: It's coming right for us!

- What will happen to the Milkyway?
 - It will continue to grow as it cannibalizes the smaller orbiting galaxies.
 - The Andromeda galaxy is on a collision course.
 - Eventually (billions of years) we will end up a combined galaxy.
 - Probably look like an elliptical galaxy.

Astronomy 230 Spring 2004

Defining Life

As we will discuss later, defining life is very difficult.
Traditional attributes of life define it as:

Jan 26, 2004

my

agriss.com

Elements of Life

- Carbon is the most important element in life on Earth with oxygen and nitrogen coming in a close second. But where did they come from?
- To understand this question, we need to address the origin of the Universe.
- In other words, Cosmology.

Jan 26, 2004

Astronomy 230 Spring 2004

<http://biology.clc.uc.edu/courses/bio104/atom-h2o.htm>

The Universe

- Began with a Big Bang
 - 13.7 billion years ago
- Still expanding and cooling
 - The rate of expansion is known
- It is BIG
 - As far as we are concerned, it is infinite in any direction
- The universe is homogeneous and isotropic
 - **Homogeneous** - The same “stuff” everywhere
 - **Isotropic** - The same in all directions
- Our place in the Universe is not special
 - Extension of the Copernican revolution
- The center of the Universe is everywhere or nowhere!

Jan 26, 2004

Astronomy 230 Spring 2004

What do you think?

- The Universe is expanding, how do you feel about that?

Jan 26, 2004

Astronomy 230 Spring 2004

How are Galaxies Moving?

It's 1928 and Edwin Hubble is measuring how galaxies move. What does he find?

- a) More galaxies receding than approaching.
- b) More galaxies approaching than receding.
- c) About equal numbers of each.

Jan 26, 2004

Astronomy 230 Spring 2004

Redshift of Galaxies

- Most galaxies are moving away from us.
- The farther away, the faster they are moving away.
- Or $V = H_0 \times D$
 - $H_0 = 72 \text{ km/s /Mpc}$
- What does this mean?
- Key to understanding the Universe!

Jan 26, 2004

Astronomy 230 Spring 2004

Apply it?

- In a homogenous Universe, what does the farther away the faster they move away mean?
- Draw it.

Jan 26, 2004

Astronomy 230 Spring 2004

Interpretation: View of the Universe

Egoist view– We are at the center of the Universe.

Einstein's view– The Universe is expanding, and there is no center!

Jan 26, 2004

Astronomy 230 Spring 2004

The Expanding Universe

- To describe the motion of all the galaxies in the Universe, we must use General Relativity (due to the gravity effects)
- General Relativity tells us that we live in an *expanding Universe*.
- In other words, space is stretching in all directions. This completely explains Hubble's Law.
- Overhead demo.

Jan 26, 2004

Astronomy 230 Spring 2004

Dude, The Universe is Expanding.

Jan 26, 2004

Astronomy 230 Spring 2004

Analogy– Raisin Bread

MAP890404

Raisins stay the same size.
Astronomy 230 Spring 2004

Jan 26, 2004

~~Expanding into What?~~

Jan 26, 2004

Astronomy 230 Spring 2004

Wow. The Universe is Expanding.

Jan 26, 2004

Astronomy 230 Spring 2004

Reality

- The analogies are just to help us visualize, don't get stuck in the specifics.
- The Universe has no center
- The Universe has no edge
- Concept of time and space began with the Universe, can not apply the concepts so easily.
- The Doppler Effect is not the reason that galaxies are redshifted. As space expands, it stretches the light.

Jan 26, 2004

Astronomy 230 Spring 2004

The Edge of the Universe?

- If the Universe consisted of only 48 stars?
- The spaceship, would never really see the edge of the Universe.

Jan 26, 2004

Astronomy 230 Spring 2004

<http://www.anzwers.org/free/universe/bigbang.html>

Living in an Expanding Universe

Consider a large "box" containing many galaxies

- Total mass in box today: M
- Total volume in box today: V_{today}
- **Density today** $= M/V_{\text{today}}$

How does the density of the Universe change with time? As Universe expands:

- M stays the same
- V becomes larger
- Density M/V **smaller**

Density changes with time!

- Universe was denser the past
- Universe will be less dense in future

Jan 26, 2004

Astronomy 230 Spring 2004

Putting it all together:

1. Earlier Universe was more dense
2. Earlier Universe was hotter.
3. The Universe is expanding.

The origin of the Universe can be described by the idea of the Big Bang.

Jan 26, 2004

Astronomy 230 Spring 2004

The Big Bang

- Occurred everywhere at once.
- Not an explosion into empty space.
- The Universe was suddenly filled with matter— hot and dense.
- A point, or infinite.
- The beginning of time and space.
- Expanding and cooling, eventually forming the stars and galaxies we see today.

Jan 26, 2004

Astronomy 230 Spring 2004

<http://www.answers.org/free/universe/bigbang.html>

The Backward Ride

Jan 26, 2004

Astronomy 230 Spring 2004

The Big Bang

- In the 1940s, extrapolating on Hubble's Law, George Gamow proposed the the universe began in a colossal "explosion" of expansion.
- In the 1950s, the term BIG BANG was coined by an unconvinced Sir Fred Hoyle who tried to ridicule it.
- In the 1990s, there was an international competition to rename the BIG BANG with a more appropriate name, but no new name was selected.

Jan 26, 2004

The Age of the Universe

Other methods to date the Universe:

- Radioactivity in Rock
uranium decays to lead
decay is “clock”: tells time since
uranium made in star
age > 10 billion yrs
- Globular clusters
oldest stars
age about 13 billion years

Best estimate (WMAP good to 1%):

- Age $t = 13.7$ billion years

Astronomy 230 Spring 2004

Looking Back in Time: The Observable Universe!

Jan 26, 2004

The Early Universe was *HOT*!

- If the early Universe was so hot, we should be able to see the blackbody radiation, redshifted. Right?
- Yep! It's shifted down to the microwave. Called the Cosmic Microwave Background.
- First detected by Robert Wilson and Arno Penzias.

Microwave Receiver

Jan 26, 2004

Astronomy 230 Spring 2004

The Seeds of Galaxies

These small perturbations are the fluctuations (better than 1 in a 1000) that caused the large scale structures we see today. This is what formed the galaxies. All of this happened only 380,000 years after the Big Bang.

<http://map.gsfc.nasa.gov/mig/030651/030651b.mov>

Jan 26, 2004

Astronomy 230 Spring 2004

THE VERY EARLY UNIVERSE

Since Big Bang works well so far, we have confidence to think about times earlier still:

$t \ll 1 \text{ sec} !$

- Temperature and energies are *ultrahigh*

Q: How to probe such high energies?
Hint: it's in the Great State of Illinois

Fermilab

Jan 26, 2004

Astronomy 230 Spring 2004

INNER SPACE / OUTER SPACE

Fermilab is a telescope!

Probes conditions in
Universe at 10^{-12} s

...but also...

*“The Universe is the poor
man’s accelerator”*

Probes conditions
inaccessible at laboratories

Jan 26, 2004

Astronomy 230 Spring 2004

How do we understand the early Universe?

The first time after the Big Bang that we can understand is about 10^{-43} seconds and after. For anything before that we would need a theory of everything. At that time all the 4 forces are equivalent– Gravity, Electromagnetic, Strong Nuclear Force, and the Weak Nuclear Force.

Jan 26, 2004

Astronomy 230 Spring 2004

Inflationary Period and On

- Universe went through period of extremely rapid expansion early in its history (before 10^{-32} sec)
- Expansion by more than factor of 10^{50}
- **10^{-12} second:** electromagnetic and weak forces separate
- **10^{-6} second:** free quarks condense into protons and neutrons
- **1 second:** Universe becomes transparent to neutrinos

Jan 26, 2004

Astronomy 230 Spring 2004

Big Bang Nucleosynthesis

After about 3 seconds, the temperature falls to 10^9 K and protons and neutrons can “shack-up” to form the first light elements. The Universe is a supercollider.

Also: Deuterium

Jan 26, 2004

Astronomy 230 Spring 2004

End Result: Big Bang Correctly Predicts Abundances

Nutrition Facts

Serving Size 1 g
Servings Per Universe many many

Amount Per Serving

Hydrogen	0.75 g
Helium	0.25 g
Deuterium	10^{-4} g
Lithium, etc.	10^{-10} g

Jan 26, 2004

Astronomy 230 Spring 2004

What is the Universe's Fate?

Today: Universe is expanding. What next?
Competition: gravity vs inertia

Compare: pop fly!

- Quantitative question:
- Launch speed vs speed to escape Earth

or

For Universe:

- Gravity: galaxy mass density ρ (Greek rho)
- Inertia: expansion $\rightarrow \rho_{\text{critical}}$

Both are observable!

Fate \rightarrow **quantitative** question :

- if $\rho < \rho_{\text{critical}}$ expand forever
- if $\rho > \rho_{\text{critical}}$ expansion halts, collapse

Jan 26, 2004

Astronomy 230 Spring 2004

What kind of Universe do we live in?

J

A Census of Matter

% of critical
density

22% Dark matter

Needed to explain:
galaxy rotation curves
clusters of galaxies

4.5% Ordinary matter

Made of protons, neutrons, and electrons

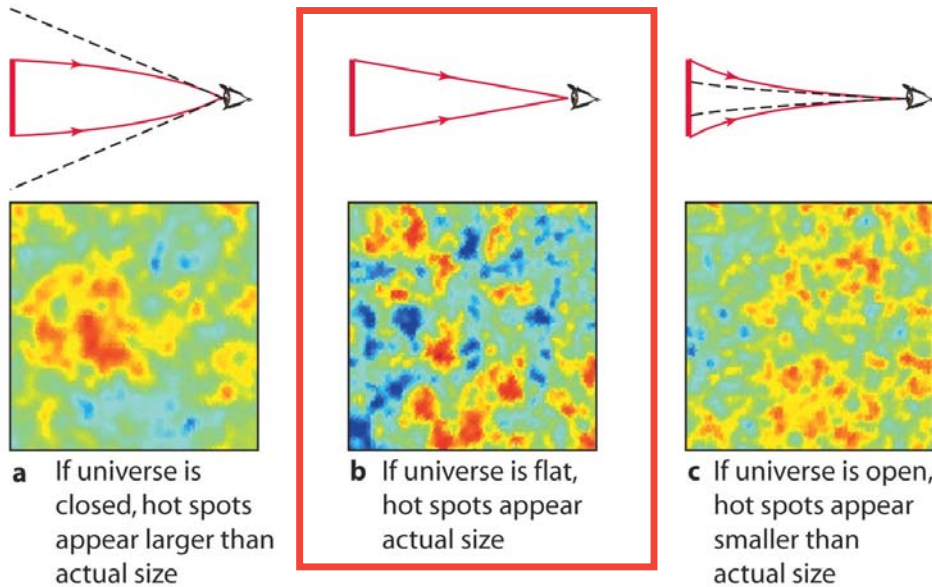

<1.5% Neutrinos

28% Total Not enough to close the Universe

Jan 26, 2004

Astronomy 230 Spring 2004

CMB Measurements: Universe is Flat

The Big Chill

- The Universe will just barely expand forever, getting cooler and cooler.
- If all of the mass, dark+regular, isn't enough, then there is something else afoot.
- The fate of the Universe is really dependent on the amount of matter and energy in the Universe.
 $E = mc^2$
- So, a new type of energy called Dark Energy (repulsive gravity and not related to Dark Matter) exists. The dark energy is dominating the fate of the Universe.
- 70% of the Universe is this dark energy.

Jan 26, 2004

Astronomy 230 Spring 2004

From the Home Office in Urbana, IL Top 3 Reasons We Believe in the Big Bang

3. Hubble: $v=HR$
+ Einstein General Relativity
= Big Bang and expanding Universe
with age $t = 13.7$ billion yrs
2. Cosmic microwave background
Primordial fireball– Big Bang working at $t = 400,000$ yrs
 - Nearly uniform temperature in all directions early Universe was very homogeneous
 - Tiny temperature fluctuations: “seeds” of galaxies
1. Big Bang Nucleosynthesis
H and (almost all) He come from Big Bang
Big Bang model working at $t = 1$ s
