Planet Formation

Feb 2, 2004

Astronomy 230 Spring 2004

Outline

- Star formation is ongoing.
- Stars form in dense molecular clouds.
- The cores collapse, and often fragment, forming multiple young stars.
- The young stars are embedded and enshrouded in dust.
- Protostars have circumstellar disks and jets that influence their environment.

Feb 2, 2004

Astronomy 230 Spring 2004

Molecular Clouds

- Interstellar clouds are important molecular factories.
- Analogous to clouds in our atmosphere
- Primarily molecular hydrogen (~93%) and atomic helium (~6%) with (~1%) heavy molecules– molecules or dust.
- H₂ is not good at emitting photons, so easier to see molecules emitting– especially CO (which tells the temperature of these clouds).
- Other molecules (mostly H₂CO, HCN, or CS) are used to derive estimates of density.

Feb 2, 2004

Astronomy 230 Spring 2004

Giant Molecular Clouds

- Cool: < 100 K
- Dense: 10² – 10⁵ H₂ molecules/cm³ (still less dense than our best vacuum)
- Huge: 10 – 100 pc across, 10⁵ – 10⁶ solar masses
- CO molecular emission & dust emission structure

3 Lessons of Interstellar Molecules

- Molecules with as many as 13 atoms have evolved in places other than Earth.
 - In our Galaxy and beyond.
 - Hard thing is getting the lab data for searching for more complicated molecules.
 - Evidence for polycyclic aromatic hydrocarbons (PAHs) links of carbon atoms with hydrogen on the outside is found in space.
 - Also found in the exhaust of cars and may play a role in early life.
- Dominance of carbon in interstellar chemistry. So perhaps carbon based life forms is not just Earth chauvinism.
- Study of these in space illustrates the problems of molecules getting more and more complex and not being destroyed by UV light. That's why they were not expected

Counting Stars

'Let's see, now ... picking up where we left off ... one billion, sixty-two million, thirty thousand, four hundred and thirteen ... one billion, sixty-two million, thirty thousand, four hundred and fourteen ...'

Spring 2004

Estimate of R_* : The Rate of formation of Sun-like stars

- We are about to start the topic of star formation and planet formation, but really the field is not well developed to estimate R_* .
- Instead take the total number of stars in the galaxy and divide by how long it took those stars to form.

$$R_* = \frac{10^{11} \text{ stars}}{10^{10} \text{ years}} = 10 \frac{\text{stars}}{\text{year}}$$

Astronomy 230 Spring 2004

Feb 2, 2004

The Interstellar Medium (ISM)

- Stuff between the Stars in a galaxy.
- Sounds sort of boring, but
 - Actually very important
 - Features complex physical processes hidden in safe dust clouds
- Every star and planet, and maybe the molecules that led to life, were formed in the dust and gas of clouds.
- Exists as either
 - Diffuse Interstellar Clouds
 - Molecular Clouds

The Importance of being a Molecular Cloud

- Different than the clouds that formed the First Stars
- Stars form in cold, dense molecular clouds (normally starless)
 - Colder, as molecules and dust easily emit in the radio and infrared.
 - Thus, clumps more easily, as the material is cold, forming regions of high density.
- Formation of more complex molecules
 - Density allows for more collisions, interactions, formation of molecules
 - *Maybe formed biological compounds?*

C¹⁸O emission from L483

How do we know?

- Young stars are seen near molecular clouds.
- In infrared light, we can see into the deeper regions of clouds, and see clusters of young stars with circumstellar material (dust and gas) surrounding them.
- Stars are continuously being formed in our galaxy.

Astronomy 230 Spring

The Birthplace of Stars

- Young stars often are seen in clusters
- Very young stars are also associated with clouds of gas (nebulae)

The Trapezium
Feb 2, 2004

Lifecycle of a Star

- Star formation
 - Take a giant molecular cloud core with its associated gravity and wait for 10^4 to 10^6 years.
- Main sequence life (depends on mass!)
 - Few $\times 10^6$ years to more than age of Universe
 - Thermonuclear burning of H to He
- Death
 - Exhaust hydrogen
 - Red giant / supergiant or supernova
 - White dwarfs, neutron stars, black holes

Feb 2, 2004

Astronomy 230 Spring 2004

Stellar Middle Age

Stars like the Sun

Massive stars

Feb 2, 2004

Astronomy 230 Spring 2004

Stars

- The fundamental building blocks of the Universe.
- High mass stars are 8 to 100 solar masses
 - Short lived: 10^6 to 10^7 years
 - Luminous: 10^3 to $10^6 L_{\text{sun}}$
 - Powers the interstellar medium– input of energy
- Intermediate Stars are 2 to 8 solar masses
- Low mass stars are 0.4 to 2 solar masses
 - Long Lived: $>10^9$ years
 - Good for planets, good for life.
 - Not so luminous: 0.001 to $10 L_{\text{sun}}$

Feb 2, 2004

Astronomy 230 Spring 2004

Star Formation

Stars are born in cold, dense interstellar clouds

- Cold gas
- Dust grains

Star formation is probably triggered by

- Cloud turbulence
- Collision with another cloud
- Nearby supernova explosion
- Nearby hot star wind
- Disturbance from the Galaxy

Feb 2, 2004

Astronomy 230 Spring 2004

Gravitational Contraction

- As we discussed for the first stars, the gravity of the gas and dust clumps pushes the clumps together, but there is some resistance from pressure and magnetic fields to collapse.
- Probably as the cloud core collapses, it fragments into blobs that collapse into individual stars.
- Cloud becomes denser and denser until gravity wins, and the clumps collapse under their own mass— a protostar.
- This process is slower than for the first stars where the clumps were much more massive.
- As the collapse proceeds the molecules and dust emit light, keeping the temperature of the core low.

Feb 2, 2004

Astronomy 230 Spring 2004

Cloud Contraction

Feb 2, 2004

Astronomy 230 Spring 2004

But..

- Not all mass falls in directly. Why?
- All gas has a small spin that preferentially causes the formation of a flattened structure – time for an interlude.

Feb 2, 2004

Astronomy 230 Spring 2004

Interlude: Angular Momentum

Spinning or orbiting objects in closed system have angular momentum.

Angular momentum is a single, *constant* number: =*conserved!*

Keep same dist. to axis → velocity same

Move closer to axis → speed up!

Recall Kepler 2nd law – really due to angular momentum!

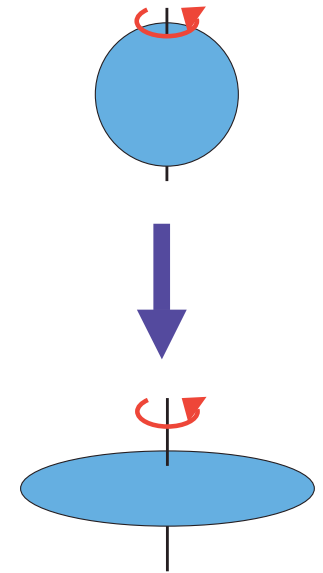

When Doves Cry and Stars Form

Solar nebula competition:
Gravity vs Angular Momentum

- If fall perpendicular to spin axis
speed up → resistance
centrifugal force
- If fall parallel to spin axis
same speed, so no resistance
→ form *protoplanetary disk*
 - Origin of ecliptic!
 - Organizes orbits in same direction
 - Organizes spins along initial spin axis

Disks Around Young Stars

- Many (> 50%) of newborn stars surrounded by a disk of material!
- Disks thick, blocks light
 - Enough material to make planets
 - Agrees with Solar Nebula theory!

Feb 2, 2004

Astronomy 230 Spring 2004

<http://www.astrosurf.com/jwisn/ttauri.htm>

On to the Main Sequence: A Star is Born!

- Density increase, temperature increases until fusion can occur.
 - Blows away most of its natal circumstellar material.
 - Becomes a star on the main sequence of the HR diagram,
 - For low mass stars, this whole process can take 10^6 years.
 - Expect to see a large number of embedded protostars.

Feb 2, 2004

Astronomy 230 Spring 2004

Some outstanding Star Formation Issues

- Why do the cores collapse, but not the entire molecular cloud?
- What sets the sizes of cores, and hence masses of stars?
- What determines how stars cluster, group together, or form multiple systems?
