Astronomy 596 Spring 2007

# Outline

- How do disks evolve?

Mar 27, 2007

Astronomy 596 Spring 2007

# SEDs

- We discussed the importance of SEDs
- It is better to resolve disks...but
- To date, few disks have been resolved, so surveys have been SED modeling
- Still have shown interesting results: disk evolution

Mar 27, 2007

Astronomy 596 Spring 2007

# Nomenclature of Evolution?

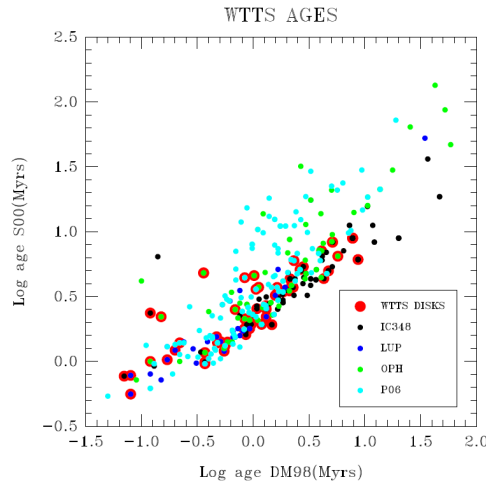

- Starless Core
- Class 0
- Class I
- Class II (T Tauri star)
- Class III
  - In general, surface temp similar to equivalent main sequence star, but they are larger, so more luminous
    - Classical T Tauri Star
    - Weak-Line T Tauri Star (or naked T Tauri Star): lacks strong emission lines in optical spectrum ( $H\alpha$  EW < 10Å; Herbig & Bell 1988)
- Main sequence (maybe with debris disk)

Mar 27, 2007

Astronomy 596 Spring 2007

Use SED surveys to probe disk evolution w/time, accretion rate, etc.

Find very few objects with moderate IR excesses, most disk systems are optically thick out to 24  $\mu$ m.

Astronomy 596!

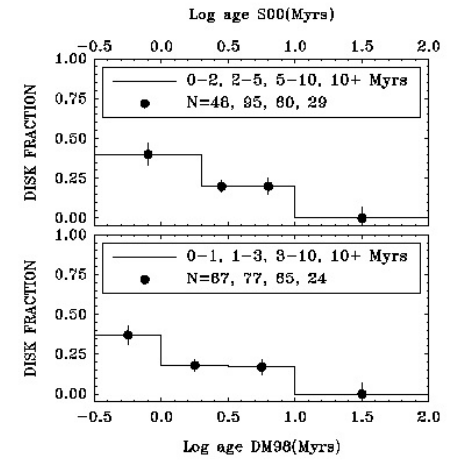

Mar 27, 2007

## Disk Fraction Correlations

For wTTs sample projected on clouds, disk fraction increases with H $\alpha$  EW, declines with age.

Mar 27, 2007

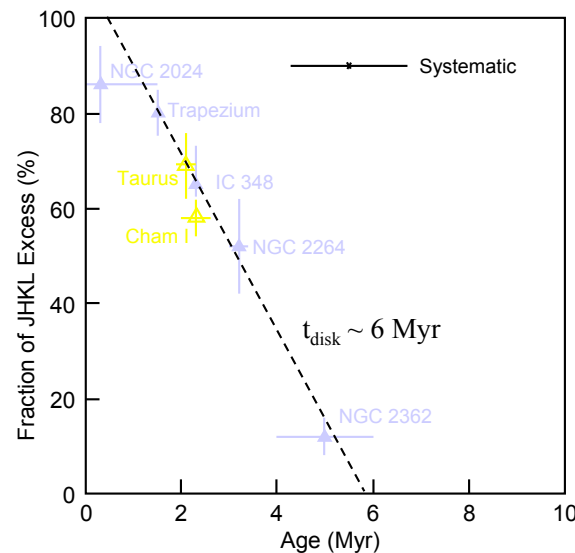

Astronomy 596 Spring 2007

Cieza et al. 2006

## Near- IR Disk Lifetimes

- L-band (3.4  $\mu$ m) light used as disk proxy
  - 900 K
  - $\geq 10^{20}$  g of dust
  - Inner disk (TBD)
- Disk lifetime  $\sim 6$  Myr
- Principal uncertainty driven by NGC 2362
- Are outer and inner disk lifetimes the same?

Astronomy 596 Spring 2007

Haisch, Lada, & Lada 2001

Mar 27, 2007

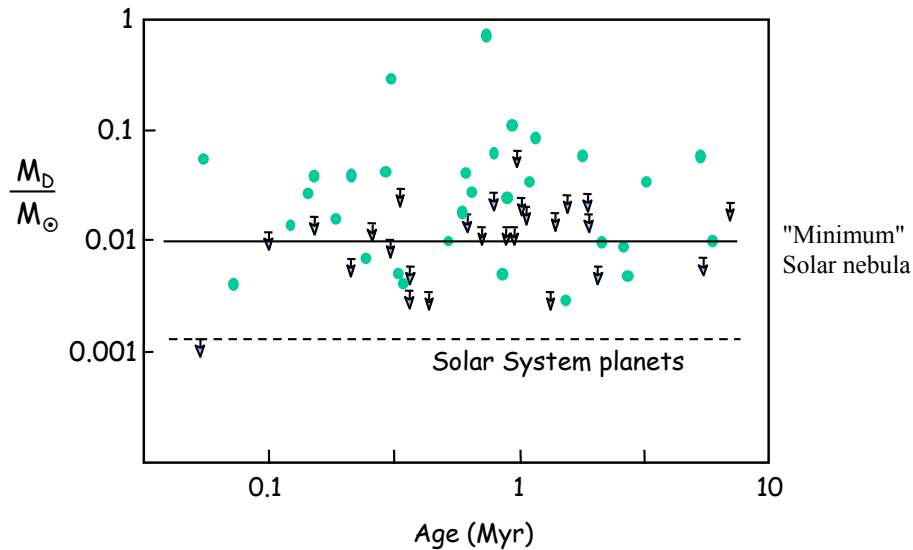

## Statistically, How Long Do Dust Grains in Disks "Survive"?

Basic result:  
Disks dissipate within a few Myr, but with a large disp. for any SINGLE system. When they go, however, the dissipation is FAST in comparison with disk "lifetime."

Gas???

# Mass Evolution

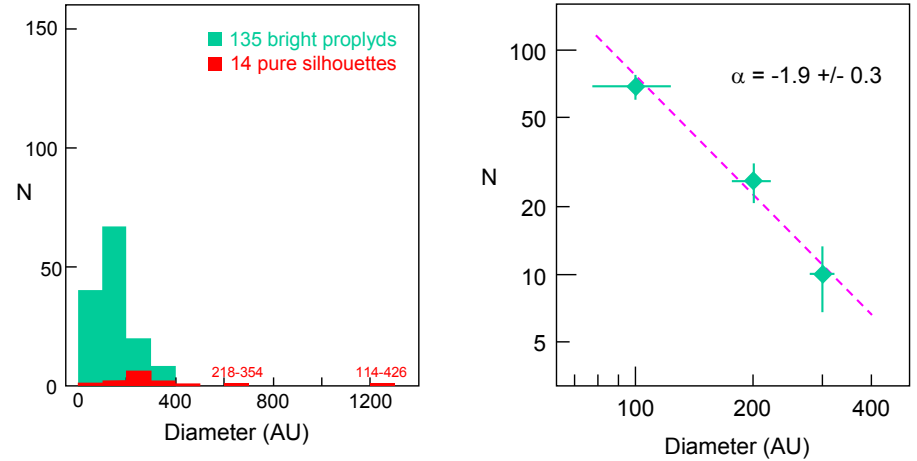

Mar 27, 2007

Beckwith et al. 1990

# Distribution of Disk Radii: Orion

Mar 27, 2007

Astronomy 596 Spring 2007

Vicente & Alves (2005)

# Disk Timescales

Some wTTs do have disks, not seen with IRAS.

But, only the young ones (age < 3 to 6 MYr)

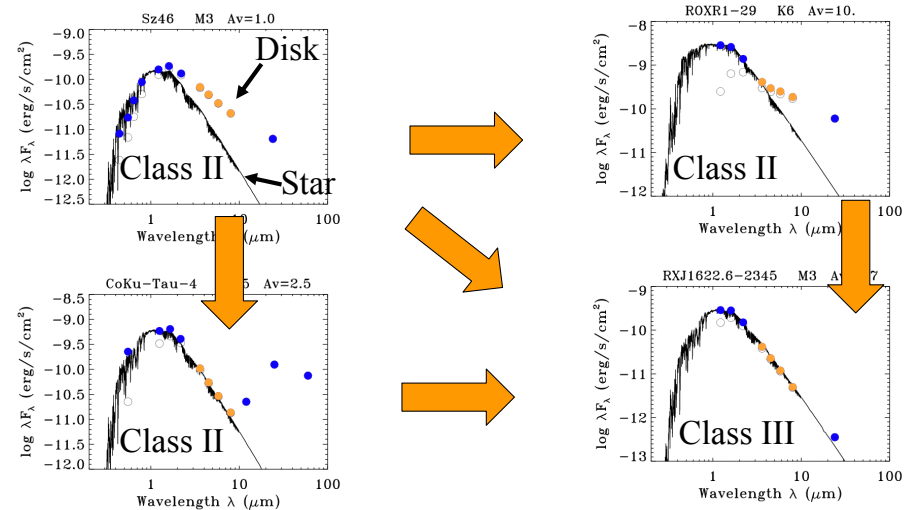

The ages are uncertain due to models, but ~half the young wTTs lack disks (even at 0.8 to 1.5 Myr).

Thus, time is NOT the only variable. How might disks evolve?

Padgett et al., 2006; Cieza et al., 2006

Mar 27, 2007

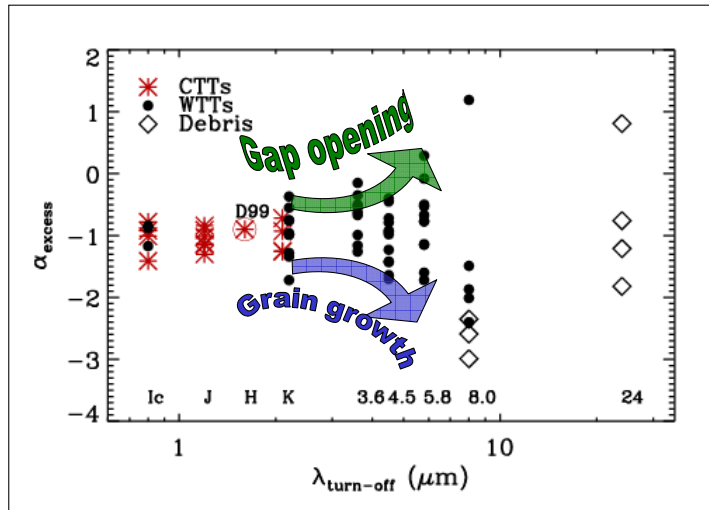

# That is, are there multiple paths from optically thick to optically thin disks?

# Mapping Evolutionary Paths?

Evolutionary sequence: cTTs → wTTs → Debris

$\alpha$  is the slope of the IR excess,  $\lambda_{\text{t-o}}$  where the star and disk contribute equally to the SED.
